ANALOG

Analog Simulation in the 1990s
by Paul K. Wang p.33 JAN

A S(t)imulating Look at Analog Design
by Shawn Hailey p.10 APR

Analog CAD: Forgotten? Or Just Neglected?
by H.G. Marsh p.18 APR

Analog Tools for Board-Level Designs
by Nader Fathi and William Kao p.26 APR

ARTWORK GENERATION/ PHOTOTOOLING/ PLOTTING

Converting Fine-Line Images to Fine-Line Circuits
by Carl Dessenberger, John Melonas and Donald F. Ball p.24 JAN

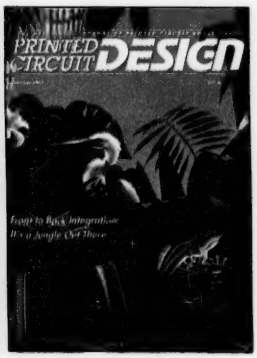
Sometimes Less is More
by Mark Lawrence p.37 APR

PCB Photoplotting Technology
by Brian Pratt p.29 OCT

Controlling the Photoplot Environment p.39 OCT

ASIC/ICs

ASIC Design on a PC?
by Bhushan Mudbhary p.29 SEP



DESIGN FOR MANUFACTURE

CAD Tools and Design for Manufacture, Part I
by Dave DeMaria p.10 MAY

Notes from the Front
by Charles Silsby p.16 MAY

Apple's Core Competence Team
by Edward G. Palmer p.32 MAY

Concurrent Engineering Environments
by Tim Bogard, Bob Hawisczak and Tom Monro p.30 JUN

CAD Tools and Design for Manufacture, Part II
by Dave DeMaria p.38 JUN

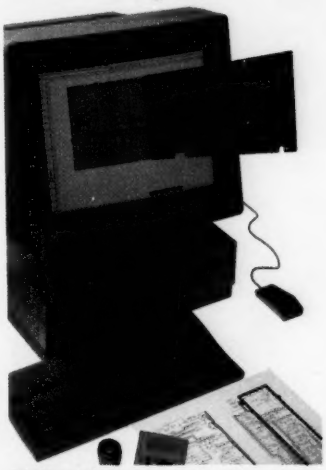
Multiple Technologies Shrink Future Printed Circuit Board Modules
by Dave Perry p.36 FEB

Application Teleconferencing
by Michael L. Paulding p.25 MAR

Strategic Partnerships
by Dennis Omanoff p.24 MAY

Do your Electronic Design on a Macintosh Computer!



Douglas CAD/CAM is a family of products for the design and manufacturing of printed circuit boards. Running on the Apple Macintosh, the entire line is quick and easy to learn. The software together with the high resolution and speed of the Macintosh provides a quality engineering work station that is very affordable and easy to use.

DesignWorks is used for schematic entry, extracting net-list and parts list data, creating and editing custom parts and display of digital circuit simulation. DesignWorks may be used on its own or with Professional Layout and AutoRouter for full integration of the Professional System.

Professional Layout, the board layout and editing package, includes parts placement for component positioning. The program may be used on its own, or with DesignWorks and AutoRouter for full integration of the Professional System.

AutoRouter, used with DesignWorks and Professional Layout, allows full use of the Professional System by automatically completing circuit connections. The net-list from DesignWorks, and the parts placement from Professional Layout provide the necessary information for routing.

The Professional System consists of three programs: DesignWorks (schematic capture), Professional Layout, and AutoRouter. The system takes full advantage of the Macintosh in addition to multilayer and SMT capabilities. A fully integrated, powerful engineering tool, the Professional System will take you from the initial schematic to the final routed circuit board.

Output from the Professional system can be sent directly to dot-matrix and LaserWriter printers and all popular pen plotters. Software is also available for generating Gerber files for photoplotting and Excellon files for drilling.

Board Manufacturing and photoplotting are also available. If you wish to use the services that Douglas Electronics provides, you may simply connect a modem to your Macintosh to get firm price quotes for boards then transmit your files for board manufacturing or photoplotting.

DON'T PAINT YOURSELF INTO A CORNER

USE PADSLINK

PADSLINK for PCB & **PADSLINK +** for 2000 free you from design limits. Now, your design may be moved into AutoCAD & other drawing & desktop publishing programs via DXF translation that really works! Drill sizes are coded automatically. Checks for multiple drill hits at the same or nearby locations, pad breakouts due to drill size and more! You can even create part decals in AutoCAD with ease, board outlines of **any shape**, complex logos, you name it. **A real time saver!** Comes with a 30 day money back guarantee, $495 & $595, both $695.

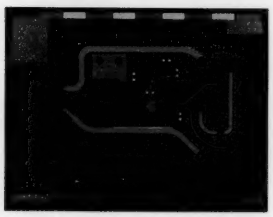
PADS-Logic-2000
Schematic Capture System
32 Bit, virtual memory code



PADS-2000
Advanced PCB Design & Layout
32 bit, 1 micron database resolution

- Multi-sheet, design-oriented database
- Fast, graphical library browsing
- Top-Down hierarchy with back-annotation
- Automatic gate and pin Assignment
- Search and query functions across all sheets
- Context sensitive cursor for copy, move, delete
- On-line logic checking across entire database
- 1000 sheet schematic capability

- ▲ Full SMT support both top & bottom
- ▲ Intelligent copper pour and edit
- ▲ Curved trace and polygon support
- ▲ Automatic thermal relief generator
- ▲ T-Routing and automatic track mitering
- ▲ Real-time checking with interactive routing
- ▲ Full design rules checking to +10 micron
- ▲ 32,000 IC design capability

DID YOU KNOW?

That to re-capture only *one* PCB design costs more than the price of an RSI-TRANSLATOR?

To re-capture or re-enter existing PCB designs in a CAD system is an extremely time-consuming task. Rebuilding library components, replacing and rerouting the board; these tasks take away valuable time.

RSI-TRANSLATORS do this for you automatically.

So call us and discover how you can save time and money with RSI-TRANSLATORS

Even if you only do one board
